

Memo: where the two hires should go

To: Priya Raman, Head of Customer Experience Cc: Arjun Mehta, Neha Kulkarni, Sameer Qureshi Data: 11,641 tickets, Jan 2025 – Jun 2026

Short answer: the data does not support putting the two hires in Billing. Billing looks biggest because the chat bot mis-tags tickets into it. Counted by who owns the actual problem, Logistics is the team under the most strain, and fixing the bot rule is worth about Rs 2.4 lakh a year on its own.

Why Billing looks biggest

Billing is 21% of all tickets. But the bot tags a ticket “Billing” when the customer mentions payment, and a large group of customers write “I paid and my order never arrived”. Reading what customers wrote and what agents noted when closing, 42% of Billing-tagged tickets in Jan–Jun 2026 were not billing issues. Most were delivery problems that were then handed to Logistics.

What changes when tickets are counted by who owns the problem

Tickets per agent per month, Jan–Jun 2026	As tagged	By real owner
Billing (4 agents)	37	26
Logistics (5 agents)	25	47
Returns Desk (3 agents)	21	24
Chat / Email / Voice Frontline (26 agents)	14 – 18	11 – 14

Neha’s read is right: Logistics resolves far more tickets than are routed to it, because it inherits the delivery cases the bot sent to Billing.

What the mis-tag costs

Compared with correctly routed Billing tickets, the mis-tagged ones are handed off 61% of the time (8% for real billing tickets), miss the first-response target 32% of the time (9%), score customer satisfaction 2.5 out of 5 (3.6), and take about two days to resolve (20 minutes). At about 190 tickets a quarter, using your policy costs (Rs 305 per hand-off, Rs 350 per missed-target credit), that is about Rs 61,000 a quarter, Rs 2.4 lakh a year.

Recommendation

- **Fix the routing first.** Ask Sameer to send “paid / not received / tracking” intakes to Logistics. Target: non-billing tickets in the Billing queue from 42% to under 10%, saving about Rs 46,000 a quarter.
- **Do not give Billing the hires on the volume case.** Its real load (26 per agent) is in line with Returns Desk and Email Frontline. If Arjun releases headcount now, the evidence points to Logistics; I would revisit Billing after two months of corrected routing.
- **Fix the breach report.** Missed first-response credits are charged to the resolving agent: Logistics is charged 423 but only 184 happened in its queue, while Billing is charged 241 of 477. Total credits over 18 months: about Rs 4.5 lakh.

How sure am I, and what I am not claiming

A check of 100 random tickets found 97 labelled exactly right and 99 under the right owning team; in the Billing-tagged ones, every ticket I flagged as “not billing” was correctly flagged. The check was done by our AI assistant, not an independent person, so treat it as encouraging, not a final audit. Tickets per agent is a rough proxy: the data has no effort-time, Escalations & Warranty is Tier 2 work that policy says should not be compared on volume, and cancellations and refund-status tickets could belong to more than one team.
